High Risk Factors:  Sickle Cell Diseases (SS, SO, or Sbetaα Thal.), Previous Stroke, Cardiac Surgery

Screening Quick Assessment Reference

Identified Focal Neurological Deficit as defined: (any one or more)

1. Weakness on one side of the body
2. Numbness on one side of the body
3. Weakness on one side of the face
4. Able to understand, but not able to speak
5. Uncoordinated on one side of the body
6. Unable to see on one side
7. Awake and alert, but “word salad” speech (meaning random words, jumbled speech)

Resource: Virtual PICU

Inclusion Criteria
- ≥18 years of age
- Onset of symptoms within 8 hours
- Patient able to undergo MRI or CT / CTA
- (MR compatible, no contrast allergies, sedation/anesthesia available if necessary) (Link to MRI Checklist)

Exclusion Criteria
- ≥18 years of age - see Stroke ≥18 years Resource Page on Careforce (Link)

tPA Exclusions
- Decline blood transfusion if indicated
- Prior intracranial hemorrhage
- Known cerebral arterial venous malformation, aneurysm, or neoplasm
- Prior stroke, major head trauma, or intracranial surgery within the past 3 months
- Possible Stroke from subacute bacterial endocarditis, moyamoya, sickle cell disease, meningitis, bone marrow, air, or fat embolism
- Pregnancy

Developed through the efforts of Children’s Healthcare of Atlanta and physicians on Children’s Medical Staff in the interest of advancing pediatric healthcare. This is a general guideline and does not represent a professional care standard governing providers’ obligation to patients. Ultimately the patient's physician must determine the most appropriate care... © 2015 Children’s Healthcare of Atlanta, Inc.
**High Risk Factors:**
Previous Stroke, Cardiac Surgery, Sickle Cell Diseases (see page 3)

**Emergent Stroke Imaging Process**

1. ED / Inpatient Attending Physician calls the CHOA Transfer Center at 5-7778 to conference the Neurologist and Radiology Physician / Neuroradiology Fellow to discuss the Imaging Plan. Inform Transfer Center - potential PICU admission.

2. Consider arrangements for sedation if necessary (MRI Checklist - link)

3. ED / Inpatient Unit sends patient to MRI or CT for imaging (Obtain Consents)

4. Consider obtaining recommended labs / starting IV

**Emergent Stroke Imaging Activation**

If MRI not immediately available or not possible, choose CT / CTA

**MRI**
(see page 4)

- DWI + Positive (Diffusion Weighted Imaging)
- DWI – Negative (Diffusion Weighted Imaging)
- Radiology Attending or Neuroradiology Fellow calls Neurology Attending with MRI results immediately
- Neurology calls ED / Inpatient Physician with results
- Continue with Limited MRI Stroke Protocol (page 4)
- Patient to return to ED / home department to Re-Evaluate plan of care
- Disposition patient to PICU for Immediate Management

**CT / CTA**
(see page 4)

- CT/CTA + positive
- CT/CTA - Negative
- Radiology Attending or Neuroradiology Fellow calls Neurology Attending with CT/CTA results immediately
- Neurology calls ED / Inpatient Physician with results
- Patient to return to ED / home department to Re-Evaluate plan of care

**Recommended Labs/ Orders**

- Imaging / Testing:
  - Stroke Imaging Path
  - EKG
  - ECHO (inpatient)
  - Keep patient NPO

- Labs:
  - Start IV
  - CBC
  - CMP
  - Cardiac Enzymes
  - CBC with differential
  - DIC Panel
  - Serum pregnancy test, qualitative
  - Lipid Profile (inpatient)

- Consults:
  - Neurology consult
  - PT / OT / Speech / Physiatry for rehab assessment

- Therapeutics:
  - Consider ITPA or antithrombotic
  - O2 Sats – assess O2 need
  - VTE Prophylaxis

**Evaluate patient for any Neuroimaging Exclusion Criteria for Intervention**

- Intracranial Hemorrhage on pretreatment head MRI or head CT
- Intracranial Dissection (defined as at or distal to the ophthalmic artery)
- Large Infarct volume, defined by the finding of acute infarct on MRI involving one-third or more of the complete MCA territory involvement

*Hughes Spalding Process*

- Patient with Suspected Stroke
  - < 15 years of age = Transfer to Egleston.
  - >15 years of age = Call CHOA Transfer Center to arrange a transfer to Emory University ER or Grady ER
  - All Sickle Cell Patients to be transferred to EG or SR regardless of age

**Pediatric Stroke < 18 Years - Emergent Stroke Imaging (Non Sickle Cell)**

Practice Guideline Focus: Acute Imaging Of The Stroke Patient Up To 18 Years Of Age

Children's Healthcare Of Atlanta

Developed through the efforts of Children's Healthcare of Atlanta and physicians on Children's medical staff in the interest of advancing pediatric healthcare. This is a general guideline and does not represent a professional care standard governing providers' obligation to patients. Ultimately the patient's physician must determine the most appropriate care... © 2015 Children's Healthcare of Atlanta, Inc.
1. ED/Inpatient Attending Physician completes Sickle Stroke Order Set
2. Obtain IV Access and send Labs
3. ED / Inpatient Attending Physician calls the CHOA Transfer Center at 5-7778 to conference the Hemonc Physician and Radiology Physician / Neuroradiology Fellow to discuss the Imaging Plan. Inform Transfer Center – potential PICU admission. (MRI Checklist - Link)
5. ED / Inpatient unit sends patient to Radiology (Obtain Consents)

Sickle Cell Acute Stroke Imaging

Inclusion Criteria
- Any Patient With Sickle Cell Disease

Exclusion Criteria
- No Imaging Exclusions For CT
- MRI Exclusionary Criteria (page 1)

Screening Quick Assessment Reference
Identified Focal Neurological deficit as defined: (any one or more)
1. Weakness on one side of the body
2. Numbness on one side of the body
3. Weakness on one side of the face
4. Able to understand, but not able to speak
5. Uncoordinated on one side of the body
6. Unable to see on one side
7. Awake and alert, but “word salad” speech – meaning random words, jumbled speech

Resource: Virtual PICU

Interventions:
- NPO
- Supplemental Oxygen
- Secure IV access and send labs
- Imaging Activation
- Consult Hemonc Physician on call

Stat Labs:
- CBC with differential
- Retic
- CMP
- HGBSCD (hemoglobin electropheresis)
- Human Erythrocyte Antigen (HEA) Phenotyping by DNA
- DIC Panel
- Serum pregnancy test, qualitative

Type and Cross: for Leukoreduced, sickle negative, phenotypically appropriate units based on weight (kg) for RBC exchange transfusion:
- Less than 15 kg = 3 units (includes prime)
- 15 – 35 kg = 4 units
- 36 – 55 kg = 5 units
- 56 – 75 kg = 6 units
- > 75 kg = 7-8 units

Limited MRI Sickle Cell Stroke Protocol

During MRI Hours:
DWI (Diffusion Weighted Imaging) & SWI (Susceptibility Weighted Imaging) - MRI Sequence, Axial, Send ADC Map

After MRI hours/night:
Non contrast Head CT

If during MRI Hours a scanner is not available within 90 minutes; patient should undergo a non-enhanced CT and transferred to PICU for admission and treatment.
Emergent Stroke Imaging Reference - Radiology

**NOTE:**
For the **Scottish Rite campus** only, a teleradiology service will provide reads from Midnight – 07:00 am. This service has a Stroke Alert Protocol and can provide preliminary reports within 10 minutes. If there are any concerns about any emergent study, even those read by our teleradiology service, the SR radiologist on call is available to answer questions and review studies remotely.

For the **Egleston Campus**, the Neuroradiology Attending or Fellow will be available to read films 24/7.
