Endoscopic retrograde cholangiopancreatography (ERCP)
ERCP is a specialized procedure that requires advanced training in endoscopy and helps the physician access parts of a child’s pancreas and liver. Often, it can prevent a patient from undergoing an invasive surgery. This procedure helps treat conditions, including:
- Mirizzi's disease
- Gall stones and bile stones
- Pancreatitis
- Complications from a liver transplant and liver disease

Neurogastroenterology and motility
Our team cares for children who have problems with the function of muscles or nerves of the digestive tract that can cause a variety of motility issues. We create a specialized treatment plan for each patient. We treat the following conditions:
- Achalasia (a disorder of the esophagus)
- Chronic intestinal pseudo-obstruction
- Oesophageal dysmotility
- Ehlers-Danlos syndrome, Type III
- Functional abdominal pain
- Neurogastrointestinal dysmotility

Intestinal rehabilitation/short bowel syndrome
We care for patients who receive nutrition enterally and parenterally. Our approach requires close interaction among intestinal rehabilitation physicians, nutritionists, support services and pediatric surgical services. This collaboration achieves better long-term outcomes for children with conditions, such as short-bowel syndrome secondary to necrotizing enterocolitis and congenital malformations.

Liver disease
Our team of pediatric hepatologists treats a large variety of liver-related diseases and complications, including:
- Acute liver failure
- Autoimmune hepatitis
- Biliary tract disease (biliary atresia)
- Chronic viral hepatitis
- Fatty liver disease and obesity
- Hepatitis (abnormal liver enzymes)
- Liver transplant
- Neonatal cholestasis and other childhood liver diseases
- Nonalcoholic fatty liver disease
- Portal hypertension
- Prolonged neonatal jaundice
- Rare metabolic disease
- Schonlein-Henoch disease
- Wilson disease

Pancreas disorders
As the first dedicated multidisciplinary pediatric pancreas program in the Southeast, we treat a variety of pancreatic diseases, etiologies, ranging from acute pancreatitis to rare genetic disorders and congenital malformations. Our program has a multidisciplinary approach that includes experts in pediatric pancreatic care, from a gastroenterologist specializing in pediatric pancreatectomy to pediatric surgery, an advanced endocrinologist with expertise in ECP, a pain specialist, an endocrinologist and diabetologist. In addition, our specialists are involved in nationally recognized research and developing national and international pediatric guidelines for acute and chronic pancreatitis.

Pelvic and anorectal care
Our team provides care for children with surgical diseases resulting in constipation, soiling or complication of the disease. Our multidisciplinary team of surgeons and specialists sees children with:
- Anorectal malformations
- Hirschsprung disease (requiring regular follow-up)
- Spina bifida

Weight and nutrition
The Children’s Strong4Life Clinic takes a holistic approach to treating obesity. Families complete a nutritional assessment with a registered dietitian to develop family-based lifestyle changes, including medicine, if needed, to improve long-term health. Our staff is equipped to treat conditions, including:
- Obesity
- Nonalcoholic fatty liver disease
- Hypertension
